

Netkrom

Wireless Solution for Health

Now and days healthcare organizations are frequently looking for ways to give their customers the best care available, as efficiently and cost-effectively as possible. Many tech savvy healthcare enterprises are embracing the Internet and other technologies to reach new market opportunities as a way to lower costs and increase profits. Providing a high-speed network that enables users such as patients, medical staff and administration employees the ability to have Internet and Intranet access and the capability to share important information across the network is critical in today's technological world.

By using Netkrom's products you will discover the full benefits of embracing broadband wireless technology. Netkrom would allow healthcare enterprises to create broadband wireless networks to interconnect multiple buildings at an affordable transmission rate. Netkrom's broadband wireless solution would support high bandwidth applications such as live video streaming and large imaging visuals between multiple buildings wirelessly, this is why wireless link connections are imperative for interconnecting various buildings together in a medical campus environment.

By implementing such a network remote clinics or hospitals in rural locations could have the advantage of having access to a much broader knowledge base and more resources than they would regularly have locally.

Benefits Gained from using Wireless Technology

- Elimination of Wires
- Faster Installation Times
- Elimination of Monthly Leased Line Costs
- Faster download speeds in the Network
- Better communication between employees and patients

High-Speed, **Reliable Bandwidth**

Netkrom's wireless products are perfect for Healthcare Enterprises because they are fast, reliable, secure, and provide an ample amount of bandwidth. By using Netkrom's technology, interference is minimized ensuring a more than stable service over long distances with increased data rate speeds and reliability.

Simple **Installations**

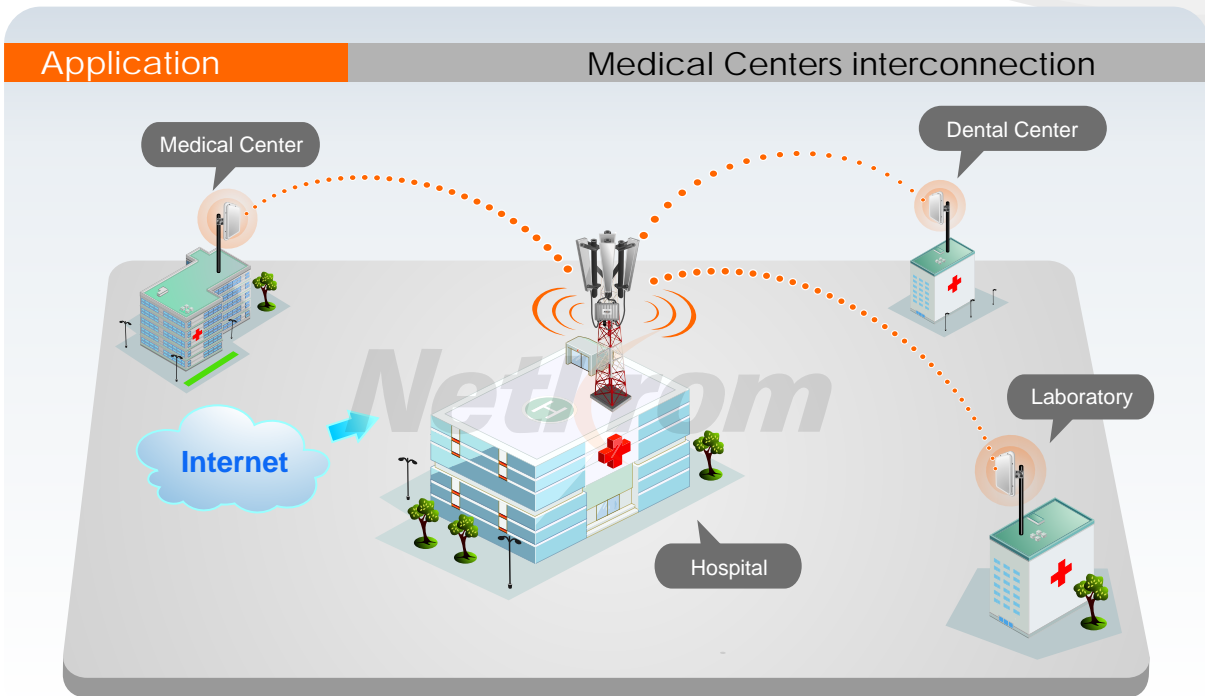

By using Netkrom's Wireless Technology, the installation of a wireless network can be established quickly, easily, and at a low cost. The addition or removal of location can be done painlessly with the implementation of our wireless networks; similarly modifications to an existing network can be done in a swift manner saving time and money.

Track **Record**

Netkrom's history and outstanding record of success stories with Wi-Fi, Mesh and WiMax equipment has been shown by assisting Healthcare businesses in various countries helping them recognize the benefits that wireless connectivity can offer. Netkrom's products have been used in a vast variety of solutions around the world.

Guaranty **Security**

All products that Netkrom offers use a high level of security to prevent unsuspecting users from breaking in or eavesdropping into the wireless network. By disguising the data traveling through the wireless network, attacks can be prevented and avoided making it practically impossible to intercept and decode transmissions.

A healthcare Association with a hospital and remote clinics/laboratories are located in the same geographical region.

The healthcare association needed to provide their employees with the ability to share patient files, X-rays imaging files, and high-speed Internet access in order to communicate in a more efficient manner and to share knowledge easier. Using Netkrom's wireless products the association set up a point-to-multipoint wireless solution that provided a high-speed connection at a low cost, it covered a 6 mile (10km) radius that would connect the main central hospital to the remote clinics and laboratories enabling them to communicate with each other flawlessly.
