

TECH SUPPORT RELEASE

MB-ROMBv3 and High Power MiniPCI modules

We have identified some problems when using MB-ROMB v3 along **Two** High Power Mini PCI modules (specifically **MB-MSAUHP**) working at their maximum capacity.

We highly recommend our customer having this set of MiniPCI cards in their MB-ROMB v3 the following:

- Lessen the Output Power given by each module. You should enable the override box in the Netkrom NMS, and select 20 dBm in both MiniPCI cards to work smoothly.
- Use only one MiniPCI module in each MB-ROMB v3. In this case, the maximum power 24 dBm can be used.
- Start using the ISP-BS500 Series, which works perfectly with all our MiniPCI modules.

It's important to mention that the rest of MiniPCI modules we offer can work along MB-ROMB v3 without problems even using them at their maximum capacity.
